STOVES

Multi fuel & wood burning stoves

Hamco

STOVES

With over a half a century and three generations of the same family, Hamco is a 100% Irish manufacturer of stoves.

At Hamco we have our own research and development team. All our products are made to the highest standards, materials and stress points are tested and reinforced to ensure we have the most durable and efficient stoves on the market.

*The question is often asked;
Which is better, Cast Iron or Steel Stoves?*

Cast Iron Stoves

Cast Iron is a traditional material that stoves have been made from for most of the history of the stove. Cast iron is much denser and heavier than steel and therefore it takes more time for the fire to heat the metal before the heat can then be radiated out into the room. On the flip side to this, the cast iron holds the heat for longer than steel and takes longer to cool once the fire has been extinguished.

Stoves made from cast iron are usually assembled, and the parts then sealed using fire cement. Every few years through normal use of the stove, due to the heating and cooling, these parts and the cement seals will need to be replaced or maintained.

Cast iron stoves usually have a very traditional look about them and are also available in a wide range of finishes. Cast iron can bond with enamel very well which is why you often see such a variety of different coloured cast iron stoves. The enamel does need some care.

Steel Stoves

Steel is very durable and conducts heat rapidly, if you want your house to warm up quickly when you light a fire then steel is a great choice.

Durability is a key factor when it comes to steel stoves, the steel parts are more durable than the cast iron alternatives. This also means less maintenance, because steel stoves are folded and welded together, they have a tighter construction and unlike the cast iron they do not use fire cement to seal it, so there is no need to worry about replacing or maintaining this every few years.

Steel stoves are generally more efficient due to tighter construction, and features such as the thermal insulating boards that we use in our stoves. The insulating boards provide superior insulating properties and high temperature shock resistance. This has two benefits of prolonging the life of the stove body while also enabling the fire to burn hotter by reflecting the heat into the stove which means better combustion and greater efficiency for you. As opposed to the traditional look of a cast iron stove, steel stoves tend to have a much cleaner contemporary look about them.

Hamco, helping to heat homes since 1966
